

WHAT IS CLAIMED IS:

1. A method of printing on a print medium with a printhead in an ink jet printer, comprising the steps of:

advancing the print medium in an advance direction a predetermined amount;

5 printing on the print medium with the printhead in an area corresponding to said predetermined amount;

determining an end of printable area on the print medium in said advance direction;

10 advancing the print medium in said advance direction a minimum reliable move amount, dependent upon said determining step, said minimum reliable move amount being less than said predetermined amount; and

printing on the print medium with the printhead in an area corresponding to said minimum reliable move amount.

2. The method of printing of claim 1, wherein said first printing step is carried out using multiple pass printing, said multiple being an integer p.

3. The method of printing of claim 2, said determining step including:

calculating whether the following mathematical relationship is true:

$$(R_t - (R_m * p)) - R_l \leq 2 * R_p$$

where,

5 R_t = a total number of raster lines in said printable area;

R_l = a current raster line number associated with said printhead which is closest to said end of printable area;

R_p = a number of raster lines corresponding to said predetermined amount; and

10 R_m = a number of raster lines corresponding to said minimum reliable move amount.

4. The method of printing of claim 3, wherein if said calculating step is a true boolean expression, then resetting said predetermined amount to a distance corresponding to $((R_t - (R_m * p)) - R_l) / 2$.

5. The method of printing of claim 4, including the step of repeating said first advancing step and said first printing step two remaining times.

6. The method of printing of claim 4, wherein said multiple pass printing corresponds to four pass printing.

7. The method of printing of claim 1, wherein said predetermined amount corresponds to an integer divisor of a height of the printhead.

8. The method of printing of claim 1, wherein said first printing step is carried out using multiple pass printing, said multiple being an integer p, and wherein said printing is carried out such that a distance d near said end of printable area subject to print degradation is represented by a mathematical expression:

$$d = (n - 1) * m$$

where,

m = minimum reliable move amount; and

n = number of passes at bottom of page = p.

9. The method of printing of claim 1, wherein said second printing step is carried out using multiple pass printing, and including the steps of repeating said second advancing step and said second printing step until a nozzle of said printhead closest to said end of printable area is immediately adjacent to said end of printable area, and then repeating said second printing step without repeating said second advancing step until said multiple passes on said printable area are complete.

10. A method of printing on a print medium with a printhead in an ink jet printer, comprising the steps of:

printing on the print medium using multiple pass printing, including the repetitive substeps of:

5 advancing the print medium in an advance direction a predetermined amount; and

 printing on the print medium with the printhead in an area corresponding to said predetermined amount;

 determining an end of printable area on the print medium in said advance
10 direction; and

printing on the print medium using adjusted multiple pass printing, dependent upon said determination of said end of printable area, including the repetitive substeps of:

15 advancing the print medium in said advance direction a minimum reliable move amount, said minimum reliable move amount being less than said predetermined amount; and

printing on the print medium with the printhead in an area corresponding to said minimum reliable move amount.

11. The method of printing of claim 10, wherein said multiple pass printing of said first printing step is carried out with a multiple represented by an integer p.

12. The method of printing of claim 11, said determining step including: calculating whether the following mathematical relationship is true:

$$(R_t - (R_m * p)) - R_l \leq 2 * R_p$$

where,

5 R_t = a total number of raster lines in said printable area;

R_l = a current raster line number associated with said printhead which is closest to said end of printable area;

R_p = a number of raster lines corresponding to said predetermined amount; and

10 R_m = a number of raster lines corresponding to said minimum reliable move amount.

13. The method of printing of claim 12, wherein if said calculating step is a true boolean expression, then resetting said predetermined amount to a distance corresponding to $((R_t - (R_m * p)) - R_l) / 2$.

14. The method of printing of claim 10, wherein said second printing step using adjusted multiple pass printing includes the substeps of repeating said second advancing step and said second printing step until a nozzle of said printhead closest to said end of printable area is immediately adjacent to said end of printable area, and then repeating
5 said second printing step without repeating said second advancing step until said multiple passes on said printable area are complete.
